

Stainless Steel Care and Preventative Maintenance Guide

Congratulations on owning one of the finest swimming pool products in the world. ASTRALPOOL prides themselves on the quality of our products. As any quality product, proper care will enhance the value of your purchase. ASTRALPOOL stainless steel products carry a limited 90/1-year warranty against rust and structural integrity.

- Never store any stainless product near chemical products and never add any chemicals to pool water near the area of any stainless steel product.
- Occasional maintenance is required to maintain a proper finish on all stainless surfaces.
- Using glass cleaner with a clean cotton cloth will help bring back the shine of your stainless steel product.
- If a stainless steel product shows signs of surface discoloration or rust, this is typically only a surface rust mark and a mild non-abrasive stainless steel or brass cleaner and a damp cloth can be used to remove surface buildup and restore shine.
- When any stainless product is used in an indoor facility, it is much more imperative that regular maintenance be done, vapors from chemicals in the air are trapped and will attack all metal components and cause discoloration or rusting.
- All metal products at poolside need to be electrically bonded in accordance with local codes. Among other advantages, this will help preserve the superior shine and extend the life of the product.

Following these simple procedures will extend the life of your products and keep them looking good for many years.

Thank you for choosing ASTRALPOOL USA
