

Quick Fix

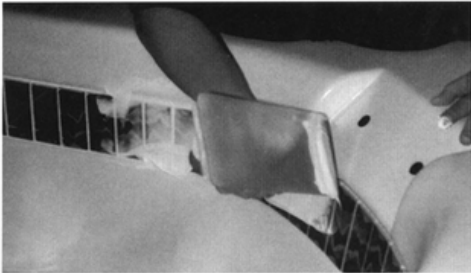

Professional Silicone Tile Adhesive & Grout Sealant

1 Press the tile firmly into place. The silicone adhesive (fast tack) cures quickly so work with small runs – no more than four or five at a time.

2 After allowing 30 minutes for the silicone adhesive to dry thoroughly, apply about half a tube of grouting (slow tack) to the tile surface.

3 Using a rubber float, spread the silicone grouting into the grout joints of the tile and trim.

4 Clean the silicone grout off the tile using a scrubber saturated with one tablespoon of liquid dish soap. The soap serves as a lubricant only.

5 Smooth and clean the grouting and surface, using light strokes to groom the grout and rid the tile surface of excess materials.
